Executive Summary

Endemic talent shortages, challenging economic conditions, the rapid growth of web-based recruiting and opportunities in social media are combining to bring about significant change in the way organisations go about recruiting. From adopting techniques used by sales and marketing teams to assessing the business case for investment in web and other technologies, HR managers face a wide range of issues as they look to build an effective talent acquisition strategy.

This Briefing Paper assesses the challenges organisations face, arguing that:

- Whether they’re filling new positions to support an expansion drive or plugging vacancies in their existing workforce, most organisations will find themselves competing to acquire high-performers in 2010. Success will depend on a combination of HR philosophy, how effectively they embrace the web, and how far they can drive through operational efficiencies, particularly in cutting costs and streamlining internal recruitment processes.

- While the balance of power may shift towards recruiters in times of high unemployment, talented individuals typically still have a choice of employer, and the onus falls on HR to promote its value proposition to candidates as much as on candidates selling their skills and experience. HR managers are encouraged to seek advice from their colleagues in sales and marketing about techniques they can use to extend their reach, promote their brand and proposition, and close deals.

- The shift to web-based recruitment – classified by Webster Buchanan as either informational or transactional - is irreversible, and organisations will fall behind in the race for talent if they fail to embrace it both for marketing purposes and to improve efficiencies (for example, by eliminating paper job applications).

- The ability to beat competitors to hire high-performing candidates will depend in part on internal efficiencies. As restrictions on IT spend are tentatively eased, organisations should weigh up the business case for automating their internal recruitment processes, either by extending their existing HR management system, using third party software, or outsourcing. Software as a Service, an IT outsourcing model, is particularly suitable for standalone business processes such as recruitment.

- Even if talent acquisition is automated as a single HR discipline, the greatest benefits come when it’s addressed in the context of a broader human capital strategy, particularly in relation to performance management, employee development, succession planning and contractor management.
Part 1: The changing recruitment landscape

1.1 Changing recruitment philosophies
Of all the different disciplines that come under HR’s remit, recruitment has probably experienced the most disruptive change in recent years. Technology advances have played a big part: the rapid growth of web-based recruiting has forced organisations to reappraise their approach to market, while the emergence of social media offers new ways to reach candidates (see Part 3.3). Challenging economic conditions have also had a major impact on both budgets and the candidate pool, with high unemployment continuing to influence market dynamics. More fundamentally, however, some of the core philosophies that underpin talent acquisition have started to be questioned.

Firstly, there’s been a perceptible shift in the relationship between candidate and recruiter, regardless of short-term economic conditions. In an era of perpetual talent shortages, the reality for many organisations is that they now have to sell the benefits of any vacancy to candidates as much as candidates have to sell their ability to do the job. It’s no coincidence that when Webster Buchanan Research carried out a survey of 100 HR managers last year\(^1\), 85% of respondents agreed that recruitment should be viewed as a sales and marketing exercise, requiring a good corporate image, good marketing skills to identify the best candidates, and good sales skills to encourage them to join. A similar number – 87% - also agreed that HR should actively seek to learn lessons from their colleagues in sales and marketing in order to improve recruitment effectiveness.

This philosophical shift is starting to show itself in a growing recognition about the importance of the candidate ‘experience’, beginning with the candidate’s initial interaction with the prospective employer, which increasingly takes place over the web. Websites need to be smartly designed and easy to navigate, and should also promote both the company and the specific vacancy. Most candidates will expect to be able to carry out transactions over the web – such as submitting job applications – as well as view information. And once an application is submitted, the efficiency of the employer’s internal recruitment process will influence the candidate’s experience, helping them decide whether this is an organization they want to be part of. Efficiency – and the common courtesy of promptly acknowledging job applications – can tip the balance when high-quality candidates make employment decisions.

\(^1\) “Recruitment 2008: from marketing theory to the practicalities of web-based hiring”, a survey of HR directors and senior managers published by Webster Buchanan Research, March 2008
There’s also a growing understanding that when a high-potential applicant approaches an organisation for the first time, it may not result in a hire – but there may be benefits in sustaining a relationship in case future opportunities arise. This approach is sometimes referred to as Candidate Relationship Management – a twist on the concept of Customer Relationship Management, the discipline that governs sales, marketing and customer service activities. By identifying the kinds of roles that a potential candidate might be looking for and sustaining their interest in the company through regular communications, organisations can quickly start up a job-specific dialogue when an appropriate opening comes up.

Secondly, the dramatic impact of the global economic recession is likely to keep management attention closely focused on value, even as recovery gets underway. For all the best intentions of HR, recruitment drives in boom years tend to be a mix of planned strategic initiatives and ad hoc responses to sudden vacancies. All of this changed dramatically in the wake of the credit crunch, when recruitment drives were replaced by swingeing job cuts and cost-cutting. Those experiences won’t be quickly forgotten, and as the cycle turns to recovery, cash-conscious companies will continue to demand tangible value from their talent acquisition investments. Many organisations will seek to apply the same comprehensive approach to recruitment that they use for capital investment, planning their requirements and assessing talent acquisition in the context of broader business need. Recruitment is also more likely to be approached as part of a broader talent management strategy encompassing workforce planning, employee development, performance management, succession planning and contractor management (see Part 1.2).

Meanwhile, as the global cycle starts to shift towards recovery, macro-economic conditions continue to dominate the recruitment landscape. The conundrum of a downturn, of course, is that more talent becomes available at a time when organisations can least afford to hire. Worse, when they do look to hire – if only to fill critical vacancies – they find themselves battling to contend with high volumes of applications in a race against nimble competitors. The need for speed, always a key factor in recruitment, intensifies in a downturn, when applicants are more anxious than usual to secure a position against a backdrop of unemployment and job insecurity, and less likely to wait for multiple offers. Now, as the focus starts to switch from survival to growth, more organisations are looking to take advantage of talent acquisition opportunities. The challenge they face is working out how to identify the highest-quality talent, how to reach out to it – and how to snap it up in the most efficient way, without increasing overhead, before competitors beat them to it.
1.2 The broader talent management picture

Increasingly, talent acquisition is being approached as one component of a broader talent management strategy, inseparable from other key HR disciplines.

As Webster Buchanan Research outlined in a report published last year\(^2\), effective talent management starts in the boardroom – not with a discussion about people, but with agreement on business objectives. Ideally, these goals will be cascaded down the corporate hierarchy to subsidiaries, divisions, departments and individuals as part of a corporate-wide performance management strategy. In turn, departmental and individual performance metrics will be adjusted, setting the context for all decisions about employee development, performance appraisals, compensation – and recruitment.

Once these business objectives have been set, the talent management cycle kicks off with a workforce planning initiative, typically incorporating four principle steps:

1. **Assessing workforce needs** by analysing the skills and competencies required for each part of the business, including new business development
2. **Analysing** existing skills and competencies
3. Carrying out a gap analysis to identify areas of need
4. **Planning skills acquisition** through performance measurement, employee development, recruitment and succession planning, accompanied by effective use of contractors

It’s particularly important that all the components of the skills acquisition phase – performance measurement, employee development, recruitment and succession planning – are tackled in conjunction with one another. Take employee development, which is a mini talent management cycle in its own right. It starts with a performance appraisal, where an individual’s strengths and weaknesses are assessed and training needs identified: this in turn feeds learning programmes and career planning. In many organisations, the link between identifying training need and fulfilling it gets broken, which ultimately can lead to unnecessary talent acquisition in the future.

Similarly, succession planning tends to be approached from a blinkered perspective, with many organisations primarily focusing on senior management. But effective succession planning isn’t merely about what happens next in the boardroom: it’s about identifying which roles are critical to the organisation, regardless of seniority. Most organisations have multiple key

person dependencies at even relatively junior levels, from an account manager who’s developed a strong personal relationship with a key client, to specialist staff who understand the intricacies of individual systems and processes. By identifying critical roles and mapping potential successors, organisations can ensure that they tailor their employee development and recruitment programmes to meet business priorities.

Contractors are also part of the equation as a tactical option to fill short-term vacancies or project-based needs. This too is a people management discipline in its own right, albeit one that’s rarely given the focus it merits. For one thing, contractor costs represent a significant overhead, one that’s often subject to very limited central control. Just as important, high-quality contractors represent key human capital assets, and should be managed with a similar eye on retention and development. Some HR systems enable organisations to store contractor records in the same database as employees, with details of their competencies, projects they’ve worked on and where relevant, managers’ performance assessments.

1.3 On-premise and outsourced options
While recruitment planning is best approached in the context of a broader talent management strategy, it will often be executed as a standalone activity. It is after all a discrete process: data is fed in at the beginning of the recruitment cycle, output data is passed to the HR management system and other business systems once a candidate has been selected, and in between, it’s a standalone set of processes.

The discrete nature of the process helps explain why recruitment lends itself particularly well to a hosted services or Software as a Service (SaaS) outsourcing model. In a SaaS set-up, the vendor runs and manages the software on its own IT infrastructure, and users access it over the internet, in much the same way that they would work with an in-house server. Because of the standalone nature of the recruitment process, it can be shifted in its entirety to a SaaS model without significantly disrupting other HR operations. At the end of the process, the data outputs from a SaaS recruitment service can be fed into the organisation’s core HR management system, and specific process steps – such as a job acceptance – can trigger other processes, such as onboarding (see Part 2.4).

This approach has a number of advantages. From a technology perspective, it removes the need for organisations to install, manage and upgrade the recruitment software - and because the vendor manages upgrades centrally,
customers will always have access to the most up-to-date software. In addition, because the service is internet-based, it can be accessed by employees from anywhere, including when they work from remote offices or from home.

From a financial perspective, meanwhile, customers may be able to bypass capital expenditure restrictions and avoid heavy upfront costs, since SaaS fees are usually charged on a subscription basis rather than via an upfront licence fee.

Typical concerns for customers going down the hosted services route centre on getting assurances about privacy, data security and uptime. Customers will also want to know that the service can be effectively integrated with their existing HR management system.

1.4 New forms of measurement
As recruitment strategies and tactics shift to meet today’s talent acquisition demands, so the metrics that high-performing organisations use to monitor their recruitment performance are also evolving.

The key operational metrics that have long been the staple diet of HR reporting remain unchanged: HR will continue to report on statutory requirements such as workforce diversity, and efficiency metrics such as the number of outstanding vacancies or ‘days to hire’. At the same, however, there’s a growing need to shift away from measuring HR’s internal workings towards a more business-focused stance – one where effectiveness is as important as efficiency. If ‘days-to-hire’ is an HR efficiency metric, for example, recruitment effectiveness might be measured in terms of the quality of people hired. Similarly, days-to-hire averages might be broken down by their business impact: if the average hire is 70 days but it takes 180 days to fill a senior position in sales, that suggests recruitment resource could be better targeted.

Financial pressures mean that recruitment costs are also likely to come under closer scrutiny going forward. In the past, most HR functions have been content to record the direct costs associated with recruitment advertising. Increasingly, however, the focus will also fall on the indirect costs, such as the time spent by HR or line managers in the recruitment cycle. These kinds of metrics will become increasingly important as HR teams start to experiment with newer forms of recruitment such as social media (see Part 3.3), where the biggest overhead is resource.

As Webster Buchanan Research has repeatedly pointed out, HR functions have been slow to adopt metrics that go beyond conventional operational factors.
In a survey of HR managers carried out by Webster Buchanan in 2008⁴, for example, 82% of respondents said they reported on time/days to hire – but only 7% drilled down to analyse the root cause of delays. Measurement of time to productivity for new hires was even poorer, with only one interviewee reporting on it at the time of the survey. Likewise, only 5% of respondents reported on the retention rate of new hires (such as first-year turnover of high-quality candidates).

The level of reporting on the effectiveness of different sources of candidates was also low. Only 7% of respondents analysed the average cost of hire by source (such as newspaper or web adverts) and only 3% measured the quality of applicants by source.

These findings were reinforced by a survey of 100 HR directors carried out by Webster Buchanan Research in 2009⁵. Four out of five respondents said they were good at generating core HR metrics such as days/time to hire. But the number who were good at reporting on direct recruitment costs (such as adverts or agency fees) fell to two thirds – and those claiming to be good at reporting on indirect recruitment costs (such as time spent by HR or line managers) fell to 56%.

Given reporting trends over the last decade, there’s little evidence to suggest that there will be a sudden surge in business-centric recruitment reporting – what’s more likely is a steady increase in take-up. What is clear, however, is that high-performing organisations will look for measurement systems that reflect the more strategic approach they take to talent acquisition – which means recruitment effectiveness becomes just as significant as recruitment efficiency.

⁵ See ‘From managing information to managing change: how HR is coping in today’s challenging economy’, a survey published by Webster Buchanan Research in May 2009 www.websterb.com/hcinsider
Part 2: Managing the fundamentals

2.1 The business case for automation
Few requests for IT investment stood up to scrutiny during the height of the global financial crisis, but amid signs of economic recovery, the business case for investing in software and services to support recruitment activities is more likely to get a fair hearing, particularly if it’s built on solid returns. Certainly, as a discrete investment, recruitment automation offers a number of potential benefits including:

- **Reduced costs** Reducing the time spent by line managers, recruiters and HR administrators on the recruitment cycle brings a direct cost saving, triggered by measures such as:
  - Automating manual workflows
  - Implementing self-service for HR, managers, employees and candidates (see Part 2.3)
  - Receiving applications through pre-designed web forms, which reduces rekeying and associated errors and also standardises applications to make comparisons easier
  - Automated filtering of CVs

- **The ability to manage high volumes** In times of high unemployment, the average volume of applications for each post increases, putting considerable stress on organisations that rely on manual processes. To deal with high volumes, organisations face a difficult choice of throwing more resource at the problem – which increases costs – or arbitrarily reviewing selected applications, which increases the chances of missing high-quality applicants

- **Faster response** During high unemployment, the speed at which organisations can filter job applications, screen candidates (e.g. for their eligibility to work in the UK), manage the interviewing process, carry out background checks and make offers can make the difference between a successful hire and losing a high-quality candidate to a competitor

- **Improved Productivity** Automating process and data management enables new recruits to get up to speed more quickly (see Part 2.4)

- **Process standardisation** By managing workflows throughout the recruitment process, organisations can extend best practices across all hiring programmes

- **Improved employee referral processes** Referrals are a highly cost-effective sourcing strategy. Organisations can improve the effectiveness of their referral programme by automating key processes such as candidate submission and referral fee pay-out

- **Improved reporting and analysis** One by-product of automation is that it generates a central store of electronic data for analysis, enabling organisations to improve recruitment efficiency and effectiveness, focus
their efforts on filling critical roles, identify the most cost-effective sources and reduce spend on agencies (see Part 1.4)

2.2 Distinctions between software and service offerings
Recruitment software comes in many different guises, offered both for conventional on-premise systems and through outsourcing arrangements (see Part 1.3). Most HR Management Systems contain some level of recruitment capability, although often at a fairly rudimentary level – it may be centred, for example, on an Applicant Tracking System that enables organisations to capture applicant details, schedule interviews, monitor the process of applications and carry out basic reporting. HRMS providers and third party specialists frequently offer additional modules with expanded capability, such as self-service for HR and managers. Web-based recruitment provides a third tier of capability, enabling organisations to post jobs, accept job applications online and in some cases, provide candidate self-service – in effect, recentering the recruitment process around the candidate and driving the entire process from the candidate experience (see Part Three). These capabilities may be provided either as on-premise software or as a SaaS outsourced service.

Key questions to consider when assessing the capability of a system or service include:

- How effectively does it help you manage applicant data? For example:
  - Can data from your website and job boards be easily entered into the system or service? In some cases, suppliers will offer pre-built integration with third party sites
  - How easily can you configure it to filter applicants? For example, can you ask an upfront question to determine whether they are eligible to work in the UK? Does the system support CV filtering, for example, through keyword searches – and if so, how advanced is the keyword search capability?
  - Will you receive the information you want? For example, can you choose whether to enable applicants to submit a CV or fill in a form, and how easy is it to change the data requirements at a later date if your information needs change?
- Does the provider offer pre-built integration to other third party services – for example, to service providers that offer reference checks?
- How easy is it to define – and just as importantly, amend – workflows to suit your working practices? Flexibility and ease of use for business users rather than IT specialists are key differentiators
- What controls are built into the workflows? Can they be set up so that alerts are automatically issued to HR if pre-defined parameters are breached - for example, if a deadline is missed?
Is the web-based applicant-facing capability fully integrated with the system managing your internal processes? It’s not uncommon to find organisations accepting CVs electronically through a web portal, and then printing them out and rekeying them into a back-end system.

### 2.3 Self-service

Self-service capability is an important component of data and process automation, underpinning many of the efficiency gains that HR systems offer today. While some continue to perceive it largely as an administrative capability – allowing employees to change their personal details and view HR information – it in fact extends across every people management discipline. In the recruitment field, it touches all participants – including HR administrators, recruiters, line managers, external agencies and candidates – and helps automate key transactions.

At the beginning of a recruitment cycle, HR or line managers can create requisitions online, scan the database of existing candidates and view applicant information as responses come in. As the process moves on to the interview phase, some systems and services enable organisations to enter interview summaries through templates, eliminating another paper-based step. When a hiring decision is made, job offers can be generated from pre-defined templates (ensuring policy requirements are met) and on acceptance, the system should be able to trigger the necessary onboarding processes (see Part 2.4 below). Throughout, those involved in the recruitment process should be able to check on progress online and receive automated status updates.

It’s important to keep in mind that adopting self-service shifts part of the control over process management from HR administrators to managers, so it may require some modification to existing recruitment working practices. As with any change management project, HR will need to be able to demonstrate that the new approach brings tangible benefits to affected parties, usually in the form of streamlined processes, tools that give managers greater control over their own recruitment activities, and improved visibility into the overall cycle.

Externally, self-service underpins Candidate Relationship Management (see Part 1.1 and Part 3), enabling job applicants to enter their CV or application online, then track the progress of their application throughout key stages of the recruitment cycle.
2.4 Completing the acquisition cycle: onboarding

The final stage of the recruitment process is to smooth the new employee’s path into the organisation and enable them to become fully productive – a step often known as onboarding. It’s a process that touches multiple business functions, since hiring a new employee involves setting up a suitable workspace; ensuring that PCs, laptops, telephones and other mobile devices are available and configured; putting relevant data into security and associated front-of-house systems; enabling access to software applications and services; and ensuring that payroll, benefits and associated systems are up-to-date.

These requirements are often managed manually and as a series of discrete steps, and as a result, the onboarding process can be time-consuming and disjointed. Process automation and integration both help: for example, a hiring decision might automatically trigger a series of related onboarding activities. But successful onboarding is also driven by more strategic issues relating to an organisation’s broader people management IT strategy.

In conventional IT set-ups, employee data tends to be stored in multiple systems, an approach that’s prone to error, involves extensive duplication and is difficult to centrally manage. An alternative approach is to create one central store for employee data – most logically, within the HRMS – and use this to feed other systems whenever data changes. This kind of centralised approach is more efficient and also enables speedy data change (since data only needs to be changed once in the central store). As well as improving the efficiency of the onboarding process, it can also make a significant difference at the other end of the employee lifecycle, when IT and security systems need to be rapidly updated in the event of an involuntary termination.
Part 3: Web-based recruitment

3.1 Informational and transactional activities
Web-based recruitment is rapidly becoming a standard business requirement, and most organisations now recognise that they need to provide some level of applicant interface on their website. At the very least, this will include the ability to accept job applications online. However, as we explained in Part Two, it can extend to more sophisticated self-service capabilities where candidates are able to submit applications and track their progress online.

Webster Buchanan Research splits web-based recruitment into two categories:

- **Informational and promotional**, where the web is used as a means of displaying information about vacancies on the customer’s website or third party sites (including details of open posts and job descriptions) and marketing the organisation (including corporate information, employee testimonials, video walkrounds and employment policies)
- **Transactional**, where candidates are able to submit applications online and track the progress of their applications. From the employer’s perspective, transactional capability may include screening and filtering of initial applications

Take-up of web-based recruitment is still relatively slow today, with much of the emphasis still on informational components such as posting jobs. At the transactional level, according to the survey\(^6\) of HR managers published by Webster Buchanan Research in May 2009, only 13% of organisations enabled internal and external candidates to submit job applications online, although 38% planned to do so within 12 months. Similarly, just under one in ten companies surveyed enabled internal and external candidates to track the progress of their application online, with 20% planning to do so within 12 months.

The trend, however, is going in one clear direction. The survey showed that over the next two years, the vast majority of respondents – 86% - will actively encourage applicants to abandon paper-based applications and apply for jobs over the web. Similarly, 72% agreed that it’s reasonable for companies to require candidates to apply for jobs online, rather than by mail or phone. Whether employers drive this change or simply react to applicant demand remains to be seen: certainly, for many Generation Y applicants, the notion of sending a paper CV is hopelessly outdated.

\(^6\) See 'From managing information to managing change: how HR is coping in today’s challenging economy', a survey published by Webster Buchanan Research in May 2009 www.websterb.com/hcinsider
3.2 The business case
From a business case perspective, the potential benefits of web-based recruitment include:

- **Improved talent acquisition**, based on the ability to identify high-performers and beat competitors to their signature. This stems from:
  - Improved sales and marketing capability, including the ability to extend the reach of recruitment campaigns and market the employer’s organisation on the web
  - Enhancing the employer’s brand in the shape of a modern website, which is particularly important for recruiting among a younger talent pool
  - Speed of response, aided by the ability to filter applicants, standardise information (e.g. through online forms) and centralise data

- **Significant cost and efficiency gains** from handling applicant information electronically. Replacing traditional recruitment processes – where hiring organisations mail out application forms to interested parties – brings significant cost and speed benefits

3.3 Social media: the resource factor
Recruitment via social networking sites such as Facebook or Linked-in is still greeted with some scepticism in the HR community. According to Webster Buchanan’s May 2009 survey, opinion is sharply divided among HR managers about the potential benefits, with 38% of respondents agreeing that social media sites provide a great way to reach potential new recruits – and 26% disagreeing.

At their most effective, Webster Buchanan argues that social media effectively becomes a way of both automating and extending two key components of recruitment, employee referrals and candidate relationship management. In addition, it provides a means to extend the employer’s profile.

What’s still to be determined is how effective social media is as a means of sourcing candidates, what rate of return they might stabilise at, and whether they’re more suitable for specific industries or certain roles. Even though participation in social media is usually free, it’s important to keep track of the cost of time spent by HR or recruiters in marketing on and monitoring sites, which can significantly increase overall recruitment costs.
End Notes

About the Authors
Webster Buchanan Research is a market research company specialising in business management and the supporting role of technology. Webster Buchanan’s primary focus is on People Management, Multi-country Payroll, Customer Relationship Management, and Financial Management. The company is based in London, San Francisco, and Singapore. For more information and copies of recent research reports, visit www.websterb.com.

About the Sponsor
Computers in Personnel is a leading provider of software and services for people and data management. Recognising that effective people and data management are critical drivers to organisational success, it provides a broad range of software, outsourcing services, data management capability and knowledge-based services. Ciphr is a richly-functional web-enabled HR and payroll management system that helps organisations manage all aspects of people management, from recruiting and training to people data analysis. Ciphr Decisions, its HR business intelligence tool, uses sophisticated data warehousing and Microsoft analysis services, allowing you to mine and manipulate people-related information. For further information visit www.ComputersinPersonnelHR.com
